D2D Backup At A Fraction Of The Cost

Nexsan's InfiniSAN D2D disk-to-disk backup storage solutions provide enterprise-class performance at a fraction of the cost of other high-powered disk and tape systems by offering a lower cost-per-megabyte. Nexsan is able to provide the complete D2D solution through the combination of correct-cost hard disk-based, high-availability RAID implemented hardware, and a full-feature backup application.

InfiniSAN D2D backup systems scale from 160GB to multi-petabytes for environments ranging from entry-level to demanding mid-range and enterprise-class applications. The Nexsan-designed GUI interface, NexScan, provides the latest in web-based, centralized management, and monitoring features. Tele-Guard, Nexsan's phone home manager, configures operator-selectable parameters, enabling pre-emptive degradation monitoring for all system conditions.

The D2D backup solutions protect data through event-based, 24x7, incremental real-time backup to either a local on-site, on-line primary, and/or off-site secondary on-line disaster recovery system. This event-based

model eliminates the problems associated with a backup window and the danger of losing a full business day's data. The on-line random access backup provides maximum availability, eliminating the immediate need for file or server restoration. Nexsan's D2D provides immediate on-line file access and/or allows data retrieval via a LAN, WAN, Fibre, copper, or Internet connection. Designed for small to enterprise-class environments, the solutions are low profile, and available in rackmount, desktop, or Infini-Stack stackable systems.
